

# Software Engineering in der industriellen Praxis (SEIP)

Dr. Ralf S. Engelschall

**ITERATIVE APPROACH:**  
The three main and two auxiliary workflow cycles express a fully iterative engineering approach.

**FULL-CYCLE SCOPE:**  
The scope of the full main-cycle workflow usually is based on business-value-adding user scenarios.

**PEOPLE INCLINATIONS:**  
The five workflow cycles intentionally loosely align with the usual inclinations, which express the different types of involved people.

**EMPHASIS AND SEQUENCING:**  
The workflow step colors represent the usual workflow emphasis. Workflow steps are executed in sequence but may be skipped if dispensable.

**INTERLINKED CYCLES:**  
The three main cycles are inter-linked and can cycle through their steps at different speeds  $S(x)$ :  
 $S(BIZ) \geq S(DEV) \geq S(OPS)$

**DISCIPLINE RESPONSIBILITY:**  
Each workflow step has one or more disciplines which are responsible for continuously performing the step in practice.

# Software Engineering Steps

## 1. WORKFLOW CYCLES

The workflow has five cycles which continuously iterate through their steps. Workflow steps are executed in each cycle in sequence, but may be skipped if dispensable in a particular iteration of the process. The length of an iteration is arbitrary, but can be e.g. about 1/3 of a Scrum sprint.

## 2. WORKFLOW STEPS:

The workflow steps describe a logical activity which has to be performed. Each step relates to one or more discipline areas and their corresponding disciplines, which express the operative responsibilities for each workflow step. In each discipline individual roles act.

## 3. WORKFLOW ROLES:

The workflow roles are held by individual persons. Each role is primarily responsible for a particular workflow step. In addition, each role can be secondarily responsible for other workflow steps or at least actively support those steps.

## 4. PROJECT SCHEDULE:

To create a particular project execution schedule, the five cycles, their iterations and their steps have to be mapped onto a timeline. The cycles are mapped onto (horizontal) timeline tracks, the iterations are mapped onto (vertical) timeline phases, and the steps are mapped onto timeline activities.

## 5. PROCESS FLOWS (THE CRUX):

The activities across the cycles can (and should) be linked into individual (diagonal) waterfall-like flows, although the execution schedule, from the perspective of the cycles, is fully iterative. There are multiple such flows in parallel and they are usually highly interleaved on the project timeline in order to maximally utilize the team.

## 6. PROCESS ADAPTION:

In the meta-step ADAPT, the process is adapted by choosing which workflow steps are required for the next iteration. The major input for this decision is the current solution state and the feedback on it by the customer.

Software **products** follow a **life-cycle** of seven temporal, non-equally sized **phases**. Software Engineering **disciplines** individually focus their **efforts** on those phases and their efforts either bottom-up depend on the domain-specific **scope** or top-down do not depend on it. The amount of required **human resources** differs between those phases, too. Effort **estimations** have to take disciplines, their phase focus, their domain-specific scope dependency, and the human resource **staffing curve** into account.

## Cone of Uncertainty

The **Cone of Uncertainty** (Steve McConnell, 2006) tells how the variability of the project scope (measured in Effort, Cost or Features) in Software Development changes over time. Initially, it usually is within the range of +/- 400% of the final scope.

The early development phases Inception and Elaboration especially have to ensure that within the first 20% of the project, the variability is reduced noticeably to just +/- 50%. During the initial iterations of the Construction phase within the first 30% of the project, the variability usually can be further reduced to about +/- 25%.

For iterative/agile approaches, experience showed that during the Construction phase inherently the final scope further shifts by about + 40% due to the just step-by-step learned required details of the required solution. This especially has to be taken into account for estimations.

## Essential Elaboration Phase

### Walking Skeleton:

The **Walking Skeleton** (or **Technical Breakthrough**) is the design and implementation of the bare technical foundation of an application, still *without* any domain-specific functionalities. It is made during the Elaboration phase with the primary purpose to establish a stable integration of all technical aspects (libraries, frameworks, build procedures, etc) onto which the domain-specific functionalities later can be successively put onto.

### Agile Fixed-Price Contracts:

The **Agile Fixed-Price** is an agile variant of a fixed-price contract, not a fixed-price project with an agile development process.

There are two important inherent aspects:

First, the contract contains two types of conditions: one (usually *Time & Material* but fixed duration based) for the Inception and Elaboration phases in order to make experiences and to gather necessary figures, and one (usually Fixed-User-Story and/or Fixed-Price based) for the Construction and Transition phases based on deferred estimated figures, gathered in the Elaboration phase.

Second, the Fixed-Price aspect of the contract is actually based on an amount of User-Stories (resulting in costs by multiplying them with either an average hourly rate of an engineer or individual rates based on engineer job levels), which the customer can 1:1 *exchange* during the project for different deliverables.

The crux of an Agile Fixed-Price contract is: first, during the Inception and Elaboration phases the supplier can shrink the *Cone of Uncertainty* and this way its risks dramatically, and second, during the Construction and Transition phases the customer still remains flexible in scope.

## Estimation & Variability

### Three-Point Estimation and Estimation Variability Classes:

$$e = (b + 4 \times m + w) / 6 \quad \text{expected effort (weighted average)}$$

$$s = (w - b) / 6 \quad \text{standard deviation (effort variation)}$$

**b:** best-case (optimistic)  
**m:** most-likely (realistic)  
**w:** worst-case (pessimistic)

Insane Variability: +/- 10%  
Very Good Variability: +/- 15%  
Good Variability: +/- 20%  
Acceptable Variability: +/- 25%

## Sizes & Variability

### Estimation Sizes and Estimation Variability:

T-Shirt-Size (Logically)	XXS	XS	S	M	L	XL	XXL	XXXL
Fibonacci-Size (PD or SP)	0,50	1	2	3	5	8	13	21
Size Variability (-)	0,25	0,25	0,50	0,50	1,00	1,50	2,50	4,00
Size Variability (+)	0,25	0,50	0,50	1,00	1,50	2,50	4,00	8,00

Notice: Estimations can be done in *Person-Days (PD)* or *Story-Points (SP)*. In both cases, keep in mind to use something like the *Fibonacci* numbers which increase in a non-linear fashion and express the increasing variability with the increasing total amount of estimated effort.

## Conversion & Normalization

### 1. Ask Estimator:

"How many Person-Days do you need when you can focus on this task?"

### 2. Convert from Estimator to Performer:

(see also CAP model, <http://cap-model.com>)

		Performer				
		0%	10%	25%	45%	80%
Estimator	Non-Linear Effort Reduction	Novice	Practitioner	Master	Expert	Guru
	Novice	1,00	0,90	0,75	0,55	0,20
	Practitioner	1,11	1,00	0,83	0,61	0,22
	Master	1,33	1,20	1,00	0,73	0,27
	Expert	1,82	1,64	1,36	1,00	0,36
	Guru	5,00	4,50	3,75	2,75	1,00

## Risk Mitigation & Upscaling

### 3. Adjust for Reality:

Estimator Optimism: +30%

Performer Meetings: +20%

### 4. Adjust for Uncertainty:

Domain	Inception	Elaboration	Construction	Technology	Inception	Elaboration	Construction
unknown	30%	40%	20%	unknown	20%	60%	10%
partially known	15%	20%	10%	partially known	10%	30%	5%
fully known	0%	0%	0%	fully known	0%	0%	0%
Process	Inception	Elaboration	Construction	People	Inception	Elaboration	Construction
unknown	60%	40%	10%	unknown	60%	40%	0%
partially known	30%	20%	5%	partially known	30%	20%	0%
fully known	0%	0%	0%	fully known	0%	0%	0%

## Requirements Specification

A binding document that specifies the requirements for a solution, by focusing on the WHAT and WHY of the solution — and *not* giving instructions for the HOW.

The documented set of requirements has to be:  
correct, unambiguous, complete, consistent, ranked,  
verifiable, modifiable, and traceable.

## Requirement Classes

### FR Functional (Shall Do)

A condition or capability that a solution must have to provide its service in terms of its behaviour and information. Think: Functionality.

### NFR Non-Functional (Shall Be)

A condition, property or quality that a solution must have to satisfy a contract, standard, or other formally imposed obligation. Think: Constraints and “\*-ilities”.

## Requirement Interdependencies

### POS Positive (Backing)

One requirement supports the other (e.g. for NFRs: Maintainability and Comprehensibility usually support Adaptability, Portability, Modifiability, etc., and Scalability usually supports Availability, etc.)

### NEG Negative (Trade-Off)

One requirement interferes with the other (e.g. for NFRs: Security usually interferes with Efficiency, Usability, Performance, etc., and Orthogonality can interfere with Usability)

## Requirement Characteristics

### S Specific

The requirement is precise, unambiguous, and clear on what should be done.

### M Measurable

The requirement can be verified when it has been achieved by use of a particular test.

### A Achievable

The requirement is achievable given existing circumstances and feasible and viable solutions.

### R Relevant

The requirement is relevant to the goals of the context.

### T Time-Bound

The requirement can be achieved within a reasonable time frame.

## Requirement Life-Time

### E Enduring

The requirement lasts forever, as it is derived from core activities and organisational structures.

### V Volatile

The requirement can be temporary, as it might change over time.

## Requirement Expression

[<req-id>] <req-name>:  
<subject/actor>  
**SHALL**  
<result/action/condition>  
**BECAUSE**  
<rationale>

**Compliance**

- CMP Compliance**  
Ability to meet rules and standards
- CRT Certification**  
Ability to confirm certain characteristics
- LCN Licensing**  
Ability to permit to own and use something
- PRC Pricing**  
Ability to have reasonable price and permit charging for a product

**Operation**

- OPR Operability**  
Ability to be reasonably operated
- SPP Supportability**  
Ability to be reasonably supported
- MNT Maintainability**  
Ability to cope with changing environments and requirements
- TST Testability**  
Ability to be completely and repeatably tested
- TRC Traceability**  
Ability to track the path something takes
- MSR Measurability**  
Ability to measure characteristics according to defined metrics

**Usability**

- USB Usability**  
Ability for ease of use, user-friendliness, accessibility, convenience, intuitiveness
- CPY Comprehensability**  
Ability to be easily understood
- ACC Accessibility**  
Ability to be used by people with disabilities.

**Correctness**

- PRD Predictability**  
Ability to predict state and behaviour under run-time
- FDL Fidelity**  
Ability to reproduce state and behaviour of the real world
- RLV Relevance**  
Ability to serve as a means to a given purpose
- PRN Precision**  
Ability to be exact and accurate in operation
- CRS Correctness**  
Ability to be algorithmically correct with respect to the specification
- PRV Provability**  
Ability to mathematically prove algorithmical correctness

**Protection**

- SFT Safety**  
Ability to protect against undeliberate failures, errors and accidents
- SEC Security**  
Ability to protect against deliberate destruction, damage and harm

**Availability**

- AVL Availability**  
Ability to be operationally available anytime
- UBQ Ubiquity**  
Ability to be operationally present anywhere
- RPT Repeatability**  
Ability to repeat state and behaviour in sequence
- RPR Reproducability**  
Ability to reproduce state and behaviour from scratch
- RCV Recoverability**  
Ability to recover state and behaviour after a disastrous failure

**Quality**

- RLB Reliability**  
Ability to perform required functions under stated conditions for a specified time
- RSL Resilience**  
Ability to provide an acceptable level of service in face of faults and challenges
- RBS Robustness**  
Ability to withstand stress, pressure, or changes in procedure or circumstances
- STB Stability**  
Ability to not suffer from internal failures in service
- DRB Durability**  
Ability to keep interfaces and functionality as is for a period of time
- INT Integrity**  
Ability to keep state consistency and avoid data corruption

**Performance**

- PRF Performance**  
Ability to efficiently perform work, i.e., with a good work to time & resource ratio
- SCL Scalability**  
Ability to scale mostly linearly with changing requirements or conditions
- RSP Responsiveness**  
Ability to respond quickly to external interaction

**Structure**

- SMP Simplicity**  
Ability to be plain, natural, straight-forward and with no observable complexity
- FLX Flexibility**  
Ability to be easily modifiable in order to respond to altered circumstances
- MDL Modularity**  
Ability to consist of individually comprehensible modules
- ORT Orthogonality**  
Ability to follow great separation of concerns in design

**Execution**

- EFF Efficiency**  
Ability to perform work in the most economical way; good input/output ratio
- EFC Efficacy**  
Ability to perform work in order to getting things done and meeting targets
- EFV Effectiveness**  
Ability to perform the "right" work by setting right targets to achieve goals

**Interfacing**

- ITY Interoperability**  
Ability to correctly operate and exchange information with foreign components
- CPT Compatibility**  
Ability to correctly operate despite expected older or newer interfaces

**Evolution**

- RSB Reusability**  
Ability to reuse code or data with slight or no modifications
- ADP Adaptability**  
Ability to cope with smaller changes in the run-time environment
- PRT Portability**  
Ability to cope with larger changes in run-time environment
- CFG Configurability**  
Ability to individualize state and behaviour by non-destructive instructions
- CST Customizability**  
Ability to individualize state and behaviour by possibly destructive instructions
- EXT Extensibility**  
Ability to extend state and behaviour in a controlled way
- TLR Tailorability**  
Ability to adjust state and behaviour in a controlled way
- MDF Modifiability**  
Ability to change state and behaviour in an arbitrary way
