Software Engineering Workflow

02.3

ITERATIVE APPROACH:

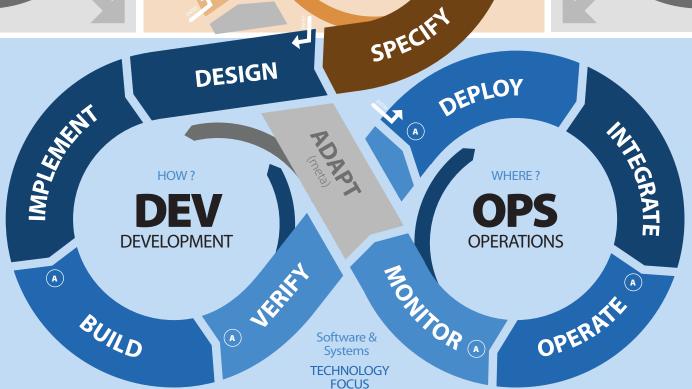

The three main and two auxiliary workflow cycles express a fully iterative engineering approach.

FULL-CYCLE SCOPE:

The scope of the full main-cycle workflow usually is based on business-value-adding user scenarios.

PEOPLE INCLINATIONS:

The five workflow cycles intentionally loosely align with the usual inclinations, which express the different types of involved people.

EMPHASIS AND SEQUENCING:

The workflow step colors represent the usual workflow emphasis. Workflow steps are executed in sequence but may be skipped if dispensable.

INTERLINKED CYCLES:

The three main cycles are inter-linked and can cycle through their steps at different speeds S(x):
S(BIZ) ≥ S(DEV) ≥ S(OPS)

DISCIPLINE RESPONSIBILITY:

Each workflow step has one or more disciplines which are responsible for continuously performing the step in practice.

constraints.

Software Engineering Process

1. WORKFLOW CYCLES

The workflow has five cycles which continuously iterate through their steps. Workflow steps are executed in each cycle in sequence, but may be skipped if dispensable in a particular iteration of the process. The length of an iteration is arbitrary, but can be e.g. about 1/3 of a Scrum sprint.

2. WORKFLOW STEPS:

The workflow steps describe a logical activity which has to be performed. Each step relates to one or more discipline areas and their corresponding disciplines, which express the operative responsibilities for each workflow step. In each discipline individual roles act.

3. WORKFLOW ROLES:

The workflow roles are held by individual persons. Each role is primarily responsible for a particular workflow step. In addition, each role can be secondarily responsible for other workflow steps or at least actively support those steps.

4. PROJECT SCHEDULE:

To create a particular project execution schedule, the five cycles, their iterations and their steps have to be mapped onto a timeline. The cycles are mapped onto (horizontal) timeline tracks, the iterations are mapped onto (vertical) timeline phases, and the steps are mapped onto timeline activities.

5. PROCESS FLOWS (THE CRUX):

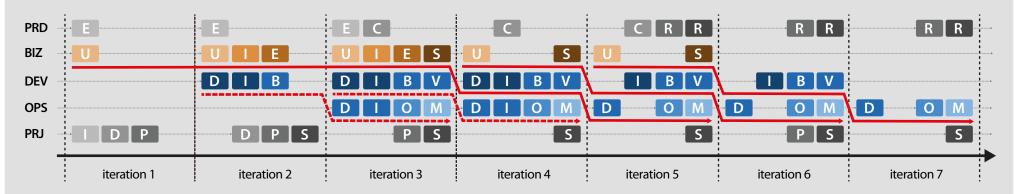

The activities across the cycles can (and should) be linked into individual (diagonal) waterfall-like flows, although the execution schedule, from the perspective of the cycles, is fully iterative. There are multiple such flows in parallel and they are usually highly interleaved on the project timeline in order to maximally utilize the team.

6. PROCESS ADAPTION:

In the meta-step ADAPT, the process is adapted by choosing which workflow steps are required for the next iteration. The major input for this decision is the current solution state and the feedback on it by the customer.

Cone of Uncertainty

Inception Elaboration

Construction

The *Cone of Uncertainty* (*Steve McConnell*, 2006) tells how the variability of the project scope (measured in Effort, Cost or Features) in Software Development changes over time. Initially, it usually is within the range of +/- 400% of the final scope.

The early development phases Inception and Elaboration especially have to ensure that within the first 20% of the project, the variability is reduced noticeably to just +/-50%. During the initial iterations of the Construction phase within the first 30% of the project, the variability usually can be further reduced to about +/-25%.

For iterative/agile approaches, experience showed that during the Construction phase inherently the final scope further shifts by about + 40% due to the just step-by-step learned required details of the required solution. This especially has to be taken into account for estimations.

Essential Elaboration Phase

Walking Skeleton:

The *Walking Skeleton* (or *Technical Breakthrough*) is the design and implementation of the bare technical foundation of an application, still *without* any domain-specific functionalities. It is made during the Elaboration phase with the primary purpose to establish a stable integration of all technical aspects (libraries, frameworks, build procedures, etc) onto which the domain-specific functionalities later can be successively put onto.

Agile Fixed-Price Contracts:

Deferred Estimated Figures for Contract Conditions 2

The *Agile Fixed-Price* is an agile variant of a fixed-price contract, *not* a fixed-price project with an agile development process.

There are two important inherent aspects:

First, the contract contains two types of conditions: one (usually *Time & Material* but fixed duration based) for the Inception and Elaboration phases in order to make experiences and to gather necessary figures, and one (usually Fixed-User-Story and/or Fixed-Price based) for the Construction and Transition phases based on deferred estimated figures, gathered in the Elaboration phase.

Second, the Fixed-Price aspect of the contract is actually based on an amount of User-Stories (resulting in costs by multiplying them with either an average hourly rate of an engineer or individual rates based on engineer job levels), which the customer can 1:1 *exchange* during the project for different deliverables.

The crux of an Agile Fixed-Price contract is: first, during the Inception and Elaboration phases the supplier can shrink the *Cone of Uncertainty* and this way its risks dramatically, and second, during the Construction and Transition phases the customer still remains flexible in scope.

Effort Estimations

 $e = (b + 4 \times m + w) / 6$ expected effort (weighted average) s = (w - b) / 6 standard deviation (effort variation)

b: best-case (optimistic)m: most-likely (realistic)w: worst-case (pessimistic)

Insane Variability: +/- 10% Very Good Variability: +/- 15% Good Variability: +/- 20% Acceptable Variability: +/- 25%

Conversion & Normalization

1. Ask Estimater:

"How many Person-Days do you need when you can focus on this task?"

2. Convert from Estimator to Performer:

(see also CAP model, http://cap-model.com)

			Pe	rform	er	
	Non-Linear Effort Reduction	%0	10%	25%	45%	%08
		Novice	Practitioner	Master	Expert	Guru
	Novice	1,00	0,90	0,75	0,55	0,20
Estimator	Practitioner	1,11	1,00	0,83	0,61	0,22
Ĭ,	Master	1,33	1,20	1,00	0,73	0,27
Est	Expert	1,82	1,64	1,36	1,00	0,36
	Guru	5,00	4,50	3,75	2,75	1,00

Sizes & Variability

Estimation Sizes and Estimation Variability:

T-Shirt-Size (Logically)	XXS	XS	S	М	L	XL	XXL	XXXL
Fibonacci-Size (PD or SP)	0,50	1	2	3	5	8	13	21
Size Variability (-)	0,25	0,25	0,50	0,50	1,00	1,50	2,50	4,00
Size Variability (+)	0,25	0,50	0,50	1,00	1,50	2,50	4,00	8,00

Notice: Estimations can be done in *Person-Days (PD)* or *Story-Points (SP)*. In both cases, keep in mind to use something like the *Fibonacci* numbers which increase in a non-linear fashion and express the increasing variability with the increasing total amount of estimated effort.

Risk Mitigation & Upscaling

3. Adjust for Reality:

Estimator Optimism: +30% Performer Meetings: +20%

4. Adjust for Uncertainty:

Domain	Inception	Elaboration	Construction	Technology	Inception	Elaboration	Construction
unknown	30%	40%	20%	unknown	20%	60%	10%
partially known	15%	20%	10%	partially known	10%	30%	5%
fully known	0%	0%	0%	fully known	0%	0%	0%
Process	Inception	Elaboration	Construction	People	Inception	Elaboration	Construction
unknown	60%	40%	10%	unknown	60%	40%	0%
partially known	30%	20%	5%	partially known	30%	20%	0%

uncertainty & efforts

Requirements Basics

Requirements Specification

A binding document that specifies the requirements for a solution, by focusing on the WHAT and WHY of the solution and *not* giving instructions for the HOW.

The documented set of requirements has to be: correct, unambiguous, complete, consistent, ranked, verifiable, modifiable, and traceable.

Requirement Classes

Functional (Shall Do)

A condition or capability that a solution must have to provide its service in terms of its behaviour and information. Think: Functionality.

NFR Non-Functional (Shall Be)

A condition, property or quality that a solution must have to satisfy a contract, standard, or other formally imposed obligation. Think: Constraints and "*-ilities".

Requirement Interdependencies

Positive (Backing)

One requirement supports the other (e.g. for NFRs: Maintainability and Comprehensibility usually support Adaptability, Portability, Modifiability, etc., and Scalability usually supports Availability, etc.)

Negative (Trade-Off)

One requirement interferes with the other (e.g. for NFRs: Security usually interferes with Efficiency, Usability, Performance, etc., and Orthogonality can interfere with Usability)

Requirement Characteristics

Specific

Measurable

achieved by use of a particular test.

Achievable

feasible and viable

Relevant

reasonable time

Requirement Life-Time

Enduring

Volatile

change over time.

Requirement Expression

BECAUSE

<rationale>

Non-Functional Requirements Tuniversität MUNCHEN

Operation

Usability

CMP Compliance Ability to meet rules and standards

CRT Certification

LCN Licensing

PRC Pricing

Ability to have reasonable price and

OPR Operability

Ability to be reasonably operated

SPP Supportability

MNT Maintainability

Ability to cope with changing environments and requirements

TST Testability

Ability to be completely and repeatably tested

TRC Traceability

MSR Measurability

USB Usability Ability for ease of use, user-friendliness, accessibility, convenience, intuitiveness

CPY Comprehensability

ACC Accessibility

. . .

PRD Predictability Ability to predict state and FDL Fidelity **RLV** Relevance PRN Precision Ability to be exact and accurate CRS Correctness **PRV** Provability Ability to mathematically prove

SFT Safety

Ability to protect against undeliberate failures, errors and accidents

SEC Security

Ability to protect against deliberate destruction, damage and harm

AVL Availability

Ability to be operationally

UBQ Ubiquity

RPT Repeatability

RPR Reproducability

Ability to reproduce state and behaviour

RCV Recoverability

RLB Reliability Ability to perform required functions under stated conditions for a specified time RSL Resilience Ability to provide an acceptable level of service in face of faults and challenges **RBS** Robustness STB Stability Ability to not suffer from internal failures in service **DRB Durability** Ability to keep interfaces and functionality as is for a period of time INT Integrity Ability to keep state consistency and avoid data corruption

Performance

Structure

PRF Performance bility to efficiently perform work, i.e.,

SCL Scalability

Ability to scale mostly linearly with changing requirements or conditions

RSP Responsiveness Ability to respond quickly to

SMP Simplicity Ability to be plain, natural, straight-forward and with no observable complexity

FLX Flexibility

MDL Modularity

Ability to consist of individually comprehensible modules

ORT Orthogonality Ability to follow great separation of concérns in design

Efficiency

Ability to perform work in the most economical way: good input/output ratio

EFC Efficacy

Execution

nterfacing

Ability to perform work in order to getting things done and meeting targets

EFV Effectiveness

Interoperability Ability to correctly operate and exchange

information with foreign components

CPT Compatibility

Ability to correctly operate despite expected older or newer interfaces

RSB Reusability

Ability to reuse code or data with slight or no modifications

ADP Adaptability Ability to cope with smaller changes in the run-time environment

PRT Portability Ability to cope with larger changes in

CFG Configurability

CST Customizability Ability to individualize state and beha-viour by possibly destructive instructions

EXT Extensibility

Ability to extend state and behaviour in a controlled way

TLR Tailorability

MDF Modifiability
