

# Software Engineering in Industrial Practice (SEIP)

Dr. Ralf S. Engelschall

## **Architecture Stargate**

Architecture is not easy to define. You can define architecture both structurally scientific through measurable elements, interfaces and relationships, or also wholely artistic through "the harmony and the accord of all parts." The "truth" lies somewhere in practice in between, because the two extremes span a broad space, in which all solutions are located in practice.

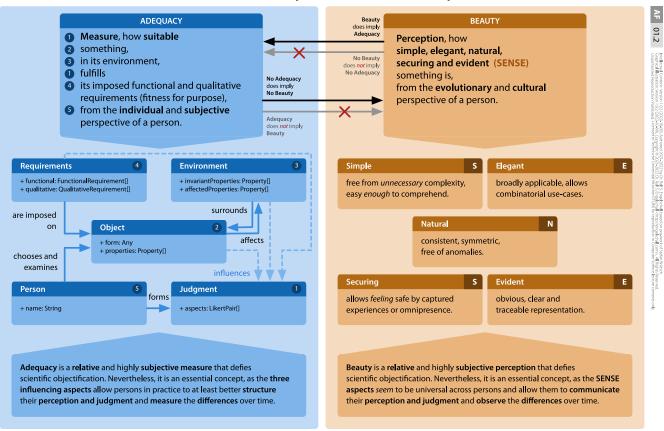

On the structurally scientific side, architecture defines itself through the aspects **Science** (in particular Computer Science) and **Engineering** (especially Software Engineering). On the holistic artistic side, architecture defines itself through the aspects of **Craftsmanship** (especially programming) and **Art** (especially User Experience).

- ? How to define Architecture?
- What are the four Aspects of Architecture?

# **Adequacy and Beauty**

Adequacy is defined as the measure, how suitable something, in its environment, fulfills its imposed functional and qualitative requirements (fitness for purpose), from the individual perspective of a person.

Adequacy is a relative and highly subjective measure that defies scientific objectification. Nevertheless, adequacy is an essential concept, as the three influencing aspects (Requirements, Environment, Object) allow persons in practice to at least better structure their perception and judgment and measure the differences over time.

Beauty is defined as the perception, how simple, elegant, natural, securing and evident (SENSE) something is, from the evolutionary perspective of a person.

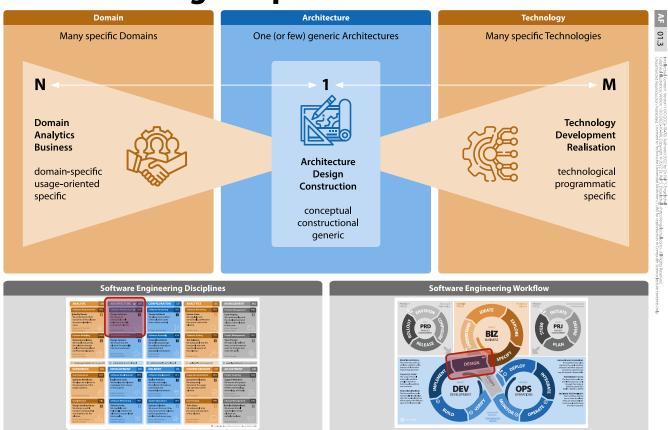

Beauty is an absolute and highly subjective perception that defies scientific objectification. Nevertheless, beauty is an essential concept, as the SENSE aspects seem to be universal across persons and allow them to communicate their perception and judgment and observe the differences over time.

- ls it possible to measure Adequacy or Beauty in general?
- Is it possible to measure Adequacy or Beauty in the context of a single person?

# **King Discipline Architecture**

(Software) **Architecture** is considered the "King Discipline" in **Software Engineering**, since it is the central, general, and conceptual link between the many, potential, specific, realized **Domains** and the many, potential, specific, realizing **Technologies**. The architectural construction of an application takes place in the logical step "Design" within the BizDevOpsworkflow of Software Engineering.

## **Questions**

Why is **Architecture** considered the "King Discipline" of Software Engineering?

## **Architecture Manifesto**

The Manifesto for IT Architecture is a policy statement for IT architecture. First and foremost, it says to "Continuously Raising the Bar", since after just 50 years of Software Engineering and Software Architecture even though we already know a number of best practices, the discipline will certainly have to continue to develop for a very long time.

The Mission for IT architects is the design, implementation, and maintenance of IT solutions. The Entitlement is to continuously raise the bar and help others to learn the "craft." Naturally is the fact that through the work of architects, the maximum added value is achieved for customers.

The basic values, which play a central role in this craft and which are greatly appreciated are: Latest Technologies, Theoretical Consideration, Analytical Engineering, Achieved Industrialization, Reactive Correction, Tested Robustness and Useful Functionality.

In addition, there are additional values, which also play a central role and are even more appreciated: Sustainable Concepts (the content of Architecture Fundamentals!), Pragmatic Making, Constructive Craftsmanship, Accredited Creativity, Proactive Improvement, Inherent Quality and Operational Delight.

## Complex vs. Complicated

FUNDAMENTALS	Complex vs. Complicated		MÜNCHEN
	complex	complicated	ı
FOCUS	refers to the <b>extrinsic</b> and <b>higher-</b> or <b>macro-</b> level difficulty of a system,	refers to the <b>intrinsic</b> and <b>lower</b> - or <b>micro</b> -level difficulty of a system,	
RATIONALE	because the system involves many different and <b>connected</b> parts	because the system involves many different and <b>difficult</b> aspects	
CHALLENGE	which take time to <b>comprehend</b> and <b>master</b> in <b>total</b> ,	which take time to <b>understand</b> and <b>learn</b> in <b>detail</b> ,	
INSIGHT	and which nevertheless are <b>easy</b> to explain.	and which usually are <b>hard</b> to explain.	
	NOTICE  Simple (non-complicated) systems can be complex.	NOTICE  Clear (non-complex) systems can be complicated.	
	PECOGNIZE	RECOGNIZE	

"Complex" refers to the extrinsic and higher- or macrolevel difficulty of a system because the system involves many different and connected parts which take time to comprehend and master in total, and which nevertheless are easy to explain.

Architecture primarily has to master

the **complex** aspects of a system.

"Complicated" refers to the intrinsic and lower- or micro-level difficulty of a system because the system involves many different and difficult aspects which take time to understand and learn in detail, and which usually are hard to explain. Note: Simple (non-complicated) systems can be complex – clear (non-complex) systems can be complicated.

**Development** primarily has to master

the **complicated** aspects of a system.

The crucial difference is: The architecture or the construction has to master the complex aspects of a system. The development or realization has to master the complicated aspects of a system.

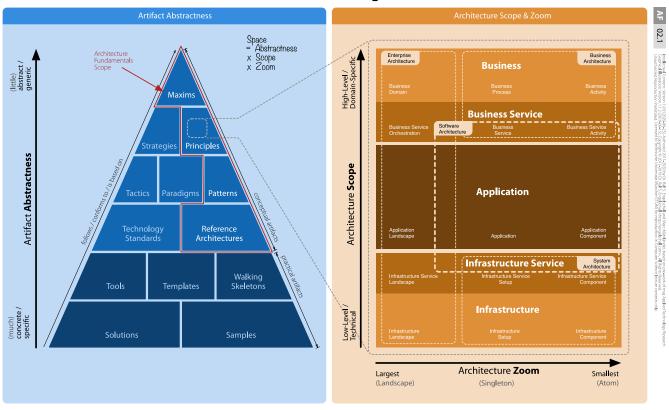

### **Questions**

② Does Architecture primarily have to deal with complex or complicated aspects of a system?

# **Architecture Space**

The IT Architecture Space consists of three dimensions: the Artifact Abstractness (a degree of abstraction of all artifacts that are known by the architect), the Architecture Scope (the field of architecture, in which one acts) and the Architecture Zoom (the detail level of architecture in which one acts).

One primarily distinguishes between three Architecture Scopes: (high-level/domain-specific) **Business**, **Application** and (low-level/technical) **Infrastructure**. In addition, the two secondary Architecture Scopes **Business Service** and **Infrastructure service** are used to reduce in practice the "mental leap" from Business to Application and from Application to Infrastructure.

On each Architecture Scope, one can choose from at least three different **Architecture Zooms**: from **Landscape** (largest), over **Singleton** to **Atom** (smallest).

In the space of Architecture Scope and Zoom, one differentiates between four types of IT architecture: Business Architecture, Software Architecture, System Architecture and Enterprise Architecture.

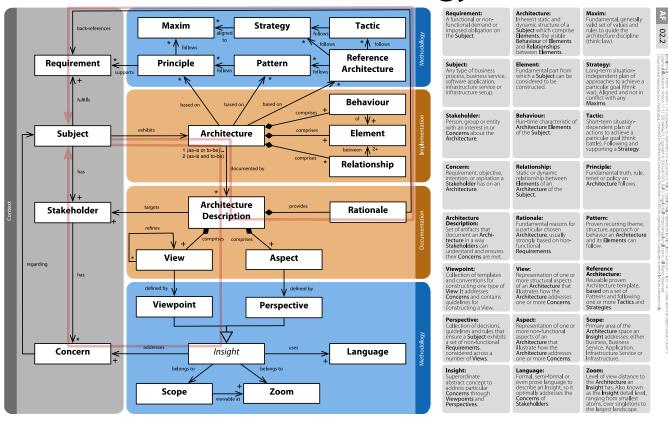

The higher/lower the level of abstraction of the artifacts, the larger/smaller usually is the coverage of the room made from Architecture Scope and Architecture Zoom.

- ? The IT Architecture Space consists of which three dimensions?
- Which four types of Architecture are known in IT?

# **Architecture Ontology**

So that Architects can communicate meaningfully in practice, one must agree on a few basic terms and their meaning. The terms are defined in a taxonomy and are described in the **Architecture Ontology** in relation to each other.

In the Architecture Ontology, there are two main important "loops." Both start at the **Subject**, which has an **Architecture**, which is documented via the **Architecture Description**.

Loop 1: The Architecture Description gives **Rationales** for decisions, which, ideally, should be back-referencing to **Requirements**. Because an Architecture Description should not document the **WHAT** but the **WHY**. Because the WHAT can also be seen in the code, but the WHY not!

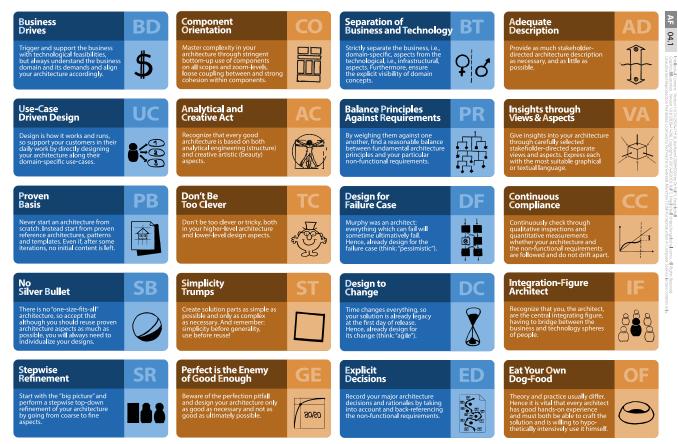

Loop 2: The Architecture Description consists of Views and Aspects, which methodically are called Viewpoints and Perspectives. Both together provide Insights at Scope and Zoom Level (see Architecture Space!) and are documented via a specific (graphical or textual) Language. In any case, only those insights will be given which address a Concern of a Stakeholder. One also doesn't program anything, which one doesn't need!

- What should an Architecture Description document beside the WHAT?
- What should an Architecture Description especially address through Insights?

## **Architecture Maxims**

In IT Architecture, one follows **Architecture Maxims**, which are basic guidelines. One knows 20 maxims. The architect should always follow the maxims and never break them.

Note: **Proven Basis** and **No Silver Bullet** say that one has to start an architecture always on a proven basis (e.g., a reference architecture), however, at the same time, it has to be clear that one cannot use these 1:1, but always first have to adjust it.

Note: **Stepwise Refinement** and **Component Orientation** say that regarding time (and for reasons of risk minimization), one always goes from the coarse to the fine, while the results show a stringent component-orientation, where small components are hierarchically integrated into larger components.

Note: while, as an IT architect, one just has to accept all maxims, **Simplicity Trumps** is from another quality: nothing in IT is really easy. When something looks simple, one just doesn't understand enough about it. Or someone really invested a lot just to make it look simple. **Simplicity Trumps** means precisely this: make inherently complex things simple again.

## **Questions**

For reasons of risk minimization, how should the IT architect at Stepwise Refinement always proceed step-by-step?
